DETAILED ACTION

1. Claim 1 has been cancelled.
2. Claim 5 has been amended.
3. Claims 2-5 are pending.

Terminal Disclaimer

1. The terminal disclaimer filed on 27 October 2009 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of US Patent No. 6,031,677 has been reviewed and is accepted. The terminal disclaimer has been recorded.

Response to Arguments

2. Applicant's arguments filed 27 October 2009 have been fully considered and they are persuasive.

Allowable Subject Matter

3. Claims **2-5** are allowed.
4. The following is an examiner's statement of reasons for allowance: The present invention is directed towards an information management apparatus and system limiting the number of times that content can be reproduced by disabling reproduction after a predetermined number of cycles. Claim 5 identifies the uniquely distinct features "**a receiver which receives main information; a recorder which records said main information on a recording medium; and a reproduction start refusing means for refusing a reproduction start command requesting start of an operation for reproducing said main information by said main information reproducer, when**

Art Unit: 2437

said decision means decides that the reproduction disabling function of said reproduction disabling means is abnormal".

The closest prior art, Ono et al. (US Patent No. 6,031,677) discloses the present invention relates to an information providing system. More particularly, this invention relates to an information management apparatus capable of reliable management of distributed information and an information providing system employing the same information management apparatus. The information management apparatus comprises a main information reproducing means for reproducing main information recorded in a given recording medium; and a reproduction management means for managing the main information reproducing means for reproducing the main information. The present invention provides a receiving means provided with a means for recording distributed information and control information limiting the number of main information reproducing cycles on a recording medium, and a main information reproducing means provided with a reproduction disabling means for limiting the reproduction of main information.

However, either singularly or in combination, Ono et al. fails to anticipate or render obvious the claimed limitations of disclosing a receiver which receives main information and a recorder which records said main information on a recording medium.

The closest prior art, Takahashi (US Patent No. 6,295,099) discloses an information recording and reproducing apparatus includes a solid-state memory medium for memorizing serial moving-image information and a reproducing circuit for

Art Unit: 2437

reproducing a plurality of pieces of moving-image information from the solid-state memory medium in parallel.

However, either singularly or in combination, Takahashi fails to anticipate or render obvious the claimed limitations of the reproduction management means provided with a reproduction disabling means for disabling operation of a main information reproducer, wherein a reproduction disabling means includes decision means for deciding whether a reproduction disabling function of the reproduction disabling means is normal, and a reproduction start refusing means for refusing a reproduction start command requesting start of an operation for reproducing said main information by said main information reproducer, when said decision means decides that the reproduction disabling function of said reproduction disabling means is abnormal.

The closest prior art, McWhirter et al. (US Patent No. 4,477,848) discloses The invention provides for the recording of an audio message and subsequent playback thereof and includes a facility for establishing whether the playback message is an authentic reproduction of the original message. The facility is obtained by producing a first data signal indicative of the audio message and recording it together with the audio message and producing a second data signal indicative of the playback message, and comparing the first and the second data signals to establish that the playback is an authentic reproduction of the original message if parity exists between the data signals.

However, either singularly or in combination, McWhirter et al. fails to anticipate or render obvious the claimed limitations of the reproduction management means provided with a reproduction disabling means for disabling operation of a main information

Art Unit: 2437

reproducer, wherein a reproduction disabling means includes decision means for deciding whether a reproduction disabling function of the reproduction disabling means is normal, and a reproduction start refusing means for refusing a reproduction start command requesting start of an operation for reproducing said main information by said main information reproducer, when said decision means decides that the reproduction disabling function of said reproduction disabling means is abnormal.

5. Therefore, **claim 5** and the respective **dependent claims 2-4** are in condition for allowance.

Conclusion

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
